SONY

Diagonal 6.23 mm (Type 1/2.9) CMOS Image Sensor with Square Pixel for Color Cameras

IMX322LQJ-C

Description

The IMX322LQJ-C is a diagonal 6.23 mm (Type 1/2.9) CMOS active pixel type image sensor with a square pixel array and approximately 2.12 M active pixels. This chip operates with analog 2.7 V, digital 1.2 V, and interface 1.8 V triple power supplies. High sensitivity, low dark current and no smear are achieved through the adoption of R, G and B primary color pigment mosaic filters. This chip features an electronic shutter with variable integration time. (Applications: Consumer use drive recorder, Consumer use network camera)

Features

- ◆ CMOS active pixel type dots
- ◆ Input clock frequency: 37.125 MHz
- ◆ Readout mode HD1080 p mode HD720 p mode
- ◆ Variable-speed shutter function (Minimum unit: One horizontal sync signal period (1XHS))
- ◆ H driver, V driver and serial communication circuit on chip
- ◆ CDS/PGA on chip

0 dB to 24 dB: Analog Gain 24 dB (step pitch 0.3 dB)

24.3 dB to 42 dB: Analog Gain 24 dB + Digital Gain 0.3 to 18 dB (step pitch 0.3 dB)

- ◆ 10-bit/12-bit A/D converter on-chip
- ◆ CMOS logic parallel SDR Data-Clock output
- ◆R, G, B primary color pigment mosaic filters on chip
- ◆ Recommended lens F value: 2.8 or more (close side)
- ◆ Recommended exit pupil distance: -30 mm to -∞

* Exmor is a trademark of Sony Corporation. The Exmor is a version of Sony's high performance CMOS image sensor with high-speed processing, low noise and low power dissipation by using column-parallel A/D conversion.

Sony reserves the right to change products and specifications without prior notice.

This information does not convey any license by any implication or otherwise under any patents or other right.

Application circuits shown, if any, are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits.

SONY IMX322LQJ-C

Device Structure

- ◆ CMOS image sensor
- ◆ Image size Diagonal 6.23 mm (Type 1/2.9)
- ◆ Total number of pixels 2000 (H) x 1121 (V) approx. 2.24 M pixels
- ♦ Number of effective pixels 1984 (H) × 1105 (V) approx. 2.19 M pixels
- ♦ Number of active pixels 1936 (H) × 1097 (V) approx. 2.12 M pixels
- ◆ Number of recommended recording pixels 1920 (H) x 1080 (V) approx. 2.07 M pixels
- ◆ Unit cell size 2.8 µm (H) x 2.8 µm (V)
- ◆ Optical black

Horizontal (H) direction: Front 16 pixels, rear 0 pixels
Vertical (V) direction: Front 16 pixels, rear 0 pixels

♦ Dummy

Horizontal (H) direction: Front 0 pixels, rear 0 pixels
Vertical (V) direction: Front 7 pixels, rear 0 pixels

Substrate material Silicon

USE RESTRICTION NOTICE

This USE RESTRICTION NOTICE ("Notice") is for customers who are considering or currently using the image sensor products ("Products") set forth in this specifications book. Sony Corporation ("Sony") may, at any time, modify this Notice which will be available to you in the latest specifications book for the Products. You should abide by the latest version of this Notice. If a Sony subsidiary or distributor has its own use restriction notice on the Products, such a use restriction notice will additionally apply between you and the subsidiary or distributor. You should consult a sales representative of the subsidiary or distributor of Sony on such a use restriction notice when you consider using the Products.

Use Restrictions

- The Products are intended for incorporation into such general electronic equipment as office products, communication products, measurement products, and home electronics products in accordance with the terms and conditions set forth in this specifications book and otherwise notified by Sony from time to time.
- You should not use the Products for critical applications which may pose a life- or injury-threatening risk or are highly likely to cause significant property damage in the event of failure of the Products. You should consult your sales representative beforehand when you consider using the Products for such critical applications. In addition, you should not use the Products in weapon or military equipment.
- Sony disclaims and does not assume any liability and damages arising out of misuse, improper use, modification, use of the Products for the above-mentioned critical applications, weapon and military equipment, or any deviation from the requirements set forth in this specifications book.

Design for Safety

 Sony is making continuous efforts to further improve the quality and reliability of the Products; however, failure of a certain percentage of the Products is inevitable. Therefore, you should take sufficient care to ensure the safe design of your products such as component redundancy, anti-conflagration features, and features to prevent mis-operation in order to avoid accidents resulting in injury or death, fire or other social damage as a result of such failure.

Export Control

 If the Products are controlled items under the export control laws or regulations of various countries, approval may be required for the export of the Products under the said laws or regulations.
 You should be responsible for compliance with the said laws or regulations.

No License Implied

• The technical information shown in this specifications book is for your reference purposes only. The availability of this specifications book shall not be construed as giving any indication that Sony and its licensors will license any intellectual property rights in such information by any implication or otherwise. Sony will not assume responsibility for any problems in connection with your use of such information or for any infringement of third-party rights due to the same. It is therefore your sole legal and financial responsibility to resolve any such problems and infringement.

Governing Law

This Notice shall be governed by and construed in accordance with the laws of Japan, without reference
to principles of conflict of laws or choice of laws. All controversies and disputes arising out of or relating
to this Notice shall be submitted to the exclusive jurisdiction of the Tokyo District Court in Japan as the
court of first instance.

Other Applicable Terms and Conditions

The terms and conditions in the Sony additional specifications, which will be made available to you when
you order the Products, shall also be applicable to your use of the Products as well as to this
specifications book. You should review those terms and conditions when you consider purchasing
and/or using the Products.

^{*1} Conversion is executed with 1 digit = 0.890 mV for 10-bit output and 1 digit = 0.2224 mV for 12-bit output.

Zone Definition of Video Signal Shading

^{*2} The video signal shading is the measured value in the wafer status (including color filter) and does not include the seal glass characteristics.

^{*3} See the Zone Definition of Video Signal Shading (diagram below) for Zone.

Image Sensor Characteristics Measurement Method

Measurement Conditions

In the following measurements, the device drive conditions are at the typical values of the bias conditions and clock voltage conditions.

In the following measurements, spot pixels are excluded and, unless otherwise specified, the optical black (OB) level is used as the reference for the signal output, which is taken as the value of the Gr/Gb channel signal output or the R/B channel signal output of the measurement system.

Color Coding of this Image Sensor and Readout

The primary color filters of this image sensor are arranged in the layout shown in the figure below. Gr and Gb represent the G signal on the same line as the R and B signals, respectively. The Gb signal and B signal lines and the R signal and Gr signal lines are output successively.

Gb	В	Gb	В
R	Gr	R	Gr
Gb	В	Gb	В
R	Gr	R	Gr

Color Coding Diagram

Definition of standard imaging conditions

◆ Standard imaging condition I:

Use a pattern box (luminance: 706 cd/m^2 , color temperature of 3200 K halogen source) as a subject. (Pattern for evaluation is not applicable.) Use a testing standard lens with CM500S (t = 1.0 mm) as an IR cut filter and image at F5.6. The luminous intensity to the sensor receiving surface at this point is defined as the standard sensitivity testing luminous intensity.

Standard imaging condition II:

Image a light source (color temperature of 3200 K) with a uniformity of brightness within 2 % at all angles. Use a testing standard lens with CM500S (t = 1.0 mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

Standard imaging condition III:

Image a light source (color temperature of 3200 K) with a uniformity of brightness within 2 % at all angles. Use a testing standard lens (exit pupil distance -30 mm) with CM500S (t = 1.0 mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

Measurement Method

1. Sensitivity

Set the measurement condition to the standard imaging condition I. After setting the electronic shutter mode with a shutter speed of 1/100 s, measure the Gr and Gb signal outputs (VGr, VGb) at the center of the screen, and substitute the values into the following formula.

$$Sg = (VGr + VGb) / 2 \times 100 / 30 [mV]$$

2. Sensitivity ratio

Set the measurement condition to the standard imaging condition II. After adjusting the average value of the Gr and Gb signal outputs to 510 mV, measure the R signal output (VR [mV]), the Gr and Gb signal outputs (VGr, VGb [mV]) and the B signal output (VB [mV]) at the center of the screen in frame readout mode, and substitute the values into the following formulas.

3. Saturation signal

Set the measurement condition to the standard imaging condition II. After adjusting the luminous intensity to 20 times the intensity with the average value of the Gr and Gb signal outputs, 510 mV, measure the average values of the Gr, Gb, R and B signal outputs.

4. Video signal shading

Set the measurement condition to the standard imaging condition III. With the lens diaphragm at F2.8, adjust the luminous intensity so that the average value of the Gr and Gb signal outputs is 510 mV. Then measure the maximum value (Gmax [mV]) and the minimum value (Gmin [mV]) of the Gr and Gb signal outputs, and substitute the values into the following formula.

$$SH = (Gmax - Gmin) / 510 \times 100 [\%]$$

Setting Registers with Serial Communication

This sensor can write and read the setting values of the various registers shown in the Register Map by 4-wire serial communication and I^2C communication. See the Register Map for the addresses and setting values to be set. Because the two communication systems are judged at the first communication, once they are judged, the communication cannot be switched until sensor reset. The pin for 4-wire serial communication and I^2C communication is shared, so the external pin XCE must be fixed to power supply side when using I^2C communication.

Some functions are set by different register according to communication method (4-wire / I²C).

Description of Setting Registers (4-wire)

The serial data input order is LSB-first transfer. The table below shows the various data types and descriptions.

Serial Data Transfer Order

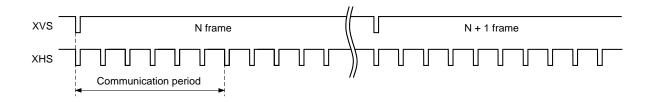

Chip ID	Start address	Data	Data	Data	•••
(8 bit)	(8 bit)	(8 bit)	(8 bit)	(8 bit)	(8 bit)

Type and Description

Туре	Description			
ChipID	02h: Write to the CID = 02h register 03h: Write to the CID = 03h register 82h: Read from the CID = 02h register 83h: Read from the CID = 03h register			
Address	Designate the address according to the Register Map. When using a communication method that designates continuous addresses, the address is automatically incremented from the previously transmitted address.			
Data	Input the setting values according to the Register Map.			

Register Communication Timing

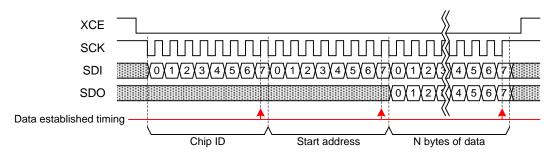

Perform register communication within the 6H period after the falling edge of XVS. Register setting values are reflected at the following timing. When communication is performed during the communication period shown in the figure below, items noted as "V" in the "Reflection timing" column of the Register Map are output in the state with the setting value reflected in the N frame. However, note that although the integration time setting is reflected in the N frame, it is reflected to shutter control after N frame readout, so the setting value is reflected to the output in the N + 1 frame. Items that are reflected instantly are reflected at the timing when communication is performed.

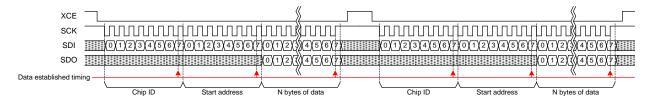

Register Reflection Timing

Register Write and Read

- ◆ Follow the communication procedure below when writing registers.
 - (1) Set XCE Low to enable the chip's communication function. Serial data input is executed using SCK and SDI.
 - (2) Transmit data in sync with SCK 1 bit at a time from the LSB using SDI. Transfer SDI in sync with the falling edge of SCK. (The data is loaded at the rising edge of SCK.)
 - (3) Input the Chip ID (CID = 02h or 03h) to the first byte. If the Chip ID differs, subsequent data is ignored.
 - (4) Input the start address to the second byte. The address is automatically incremented.
 - (5) Input the data to the third and subsequent bytes. The data in the third byte is written to the register address designated by the second byte, and the register address is automatically incremented thereafter when writing the data for the fourth and subsequent bytes. Normal register data is loaded to the inside of the sensor and established in 8-bit units.
 - (6) The register values starting from the register address designated by the second byte are output from the SDO pin. The register values before the write operation are output. The actual register values are the input data.
 - (7) Set XCE High to end communication.
- Follow the communication procedure below when reading registers.
 - (1) Set XCE Low to enable the chip's communication function. Serial data input is executed using SCK and SDI.
 - (2) Transmit data in sync with SCK 1 bit at a time from the LSB using SDI. Transfer SDI in sync with the falling edge of SCK. (The data is loaded at the rising edge of SCK.)
 - (3) Input Chip ID (CID = 82h or 83h) to the first byte. If the Chip ID differs, subsequent data is ignored.
 - (4) Input the start address to the second byte. The address is automatically incremented.
 - (5) Input data to the third and subsequent bytes. Input dummy data in order to read the registers. The dummy data is not written to the registers. To read continuous data, input the necessary number of bytes of dummy data.
 - (6) The register values starting from the register address designated by the second byte are output from the SDO pin. The input data is not written, so the actual register values are output.
 - (7) Set XCE High to end communication.
- Note) Even when changing register setting values during imaging, communication should finish within the 6H communication period. When writing data to multiple registers with discontinuous addresses, access to undesired registers can be avoided by repeating the above procedure multiple times. The figures on the following page show examples of transmission.

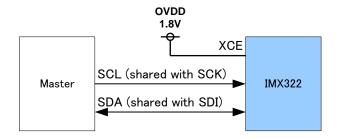

Communication Timing to Registers with Continuous Addresses

Communication Timing to Registers with Discontinuous Addresses

Description of Setting Registers (I²C)

The serial data input order is MSB-first transfer. The table below shows the various data types and descriptions.

Pin connection of serial communication

Slave address

MSB							LSB
0	0	1	1	0	1	0	R/W

^{*}R / W is data direction bit

R/W

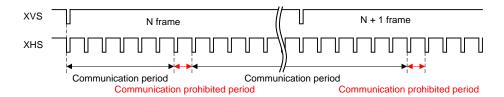

R/W	Data direction		
0	Write (Master → Sensor)		
1	Read (Sensor → Master)		

I²C pin description

Symbol	Pin No.	Description	
SDA (common to SDI) C6		Serial data communication	
SCL (common to SCK) A6		Serial clock input	

Register Communication Timing

Perform register communication within the communication period shown below. Register setting values are reflected at the following timing. When communication is performed during the communication period shown in the figure below, items noted as "V" in the "Reflection timing" column of the Register Map are output in the state with the setting value reflected in the N frame. However, note that although the integration time setting is reflected in the N frame, it is reflected to shutter control after N frame readout, so the setting value is reflected to the output in the N + 1 frame. Items that are reflected instantly are reflected at the timing when communication is performed.

Register Reflection Timing

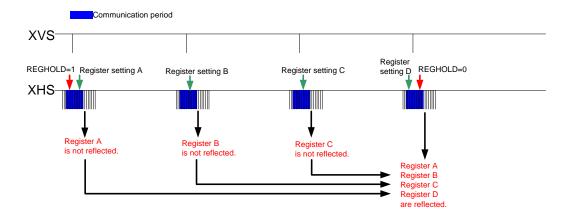

SONY IMX322LQJ-C

Register Hold Setting

Register setting can be transmitted with divided to several frames and it can be reflected globally at a certain frame by the register REGHOLD (address: 0104h [0]). Setting REGHOLD = 1 at the start of register communication period prevents the registers that are set thereafter from reflecting at the frame reflection timing. The registers that are set when setting REGHOLD = 1 are reflected globally by setting REGHOLD = 0 at the end of communication period of the desired frame to reflect the register.

Register hold register

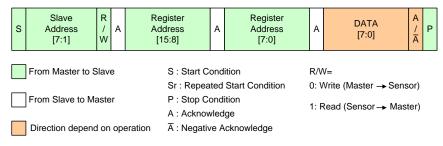

Register details		Initial value	Setting value		
Register name	Address	bit	IIIIIai vaiue	Setting value	
REGHOLD	0104h	[0]	1	0h: Invalid	
REGHOLD	GHOLD 0104h [0]		I	1h: Valid (register hold)	

Register Hold Setting

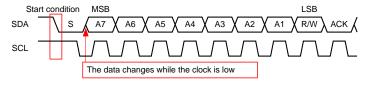

Communication Protocol

2-wire serial communication supports a 16-bit register address and 8-bit data message type.

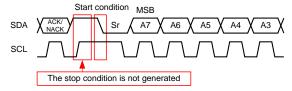

Communication protocol

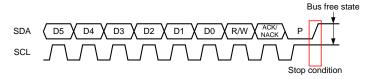

Data is transferred serially, MSB first in 8-bit units. After each data byte is transferred, A (Acknowledge) / \bar{A} (Negative Acknowledge) is transferred. Data (SDA) is transferred at the clock (SDL) cycle. SDA can change only while SCL is Low, so the SDA value must be held while SCL is High. The Start condition is defined by SDA changing from High to Low while SCL is High. When the Stop condition is not generated in the previous communication phase and Start condition for the next communication is generated, that Start condition is recognized as a Repeated Start condition.

Start Condition

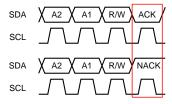

Repeated Start Condition

Stop Condition

After transfer of each data byte, the Master or the sensor transmits an Acknowledge / Negative Acknowledge and release (does not drive) SDA. When Negative Acknowledge is generated, the Master must immediately generate the Stop Condition and end the communication.

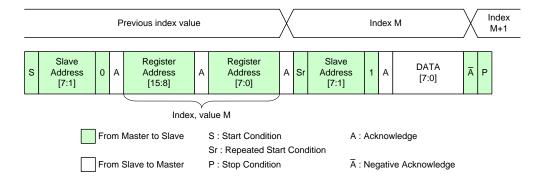

Acknowledge and Negative Acknowledge

Register Write and Read in I²C Communication

Single Read from Random Location

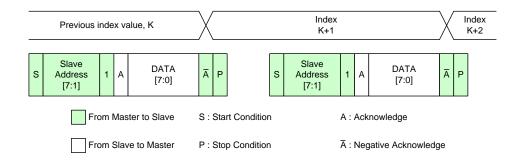

The sensor has an index function that indicates which address it is focusing on. In reading the data at an optional single address, the Master must set the index value to the address to be read. For this purpose it performs dummy write operation up to the register address. The upper level of the figure below shows the sensor internal index value, and the lower level of the figure shows the SDA I/O data flow. The Master sets the sensor index value to M by designating the sensor slave address with a write request, then designating the address (M). Then, the Master generates the start condition. The Start Condition is generated without generating the Stop Condition, so it becomes the Repeated Start Condition. Next, when the Master sends the slave address with a read request, the sensor outputs an Acknowledge immediately followed by the index address data on SDA. After the Master receives the data, it generates a Negative Acknowledge and the Stop Condition to end the communication

Single Read from Random Location

Single Read from Current Location

After the slave address is transmitted by a write request, that address is designated by the next communication and the index holds that value. In addition, when data read / write is performed, the index is incremented by the subsequent Acknowledge / Negative Acknowledge timing. When the index value is known to indicate the address to be read, sending the slave address with a read request allows the data to be read immediately after Acknowledge. After receiving the data, the Master generates a Negative Acknowledge and the Stop Condition to end the communication, but the index value is incremented, so the data at the next address can be read by sending the slave address with a read request.

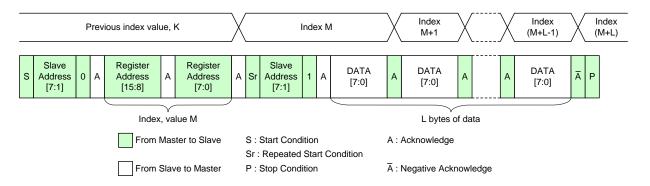

Single Read from Current Location

Sequential Read Starting from Random Location

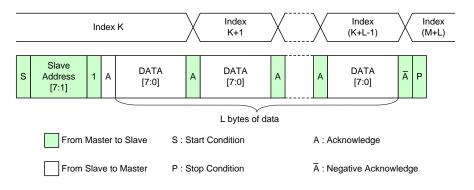

In reading data sequentially, which is starting from an optional address, the Master must set the index value to the start of the addresses to be read. For this purpose, dummy write operation includes the register address setting. The Master sets the sensor index value to M by designating the sensor slave address with a read request, then designating the address (M). Then, the Master generates the Repeated Start Condition. Next, when the Master sends the slave address with a read request, the sensor outputs an Acknowledge followed immediately by the index address data on SDA. When the Master outputs an Acknowledge after it receives the data, the index value inside the sensor is incremented and the data at the next address is output on SDA. This allows the Master to read data sequentially. After reading the necessary data, the Master generates a Negative Acknowledge and the Stop Condition to end the communication.

Sequential Read Starting from Random Location

Sequential Read Starting from Current Location

When the index value is known to indicate the address to be read, sending the slave address with a read request allows the data to be read immediately after the Acknowledge. When the Master outputs an Acknowledge after it receives the data, the index value inside the sensor is incremented and the data at the next address is output on SDA. This allows the Master to read data sequentially. After reading the necessary data, the Master generates a Negative Acknowledge and the Stop Condition to end the communication.

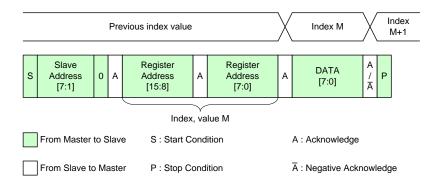

Sequential Read Starting from Current Location

Single Write to Random Location

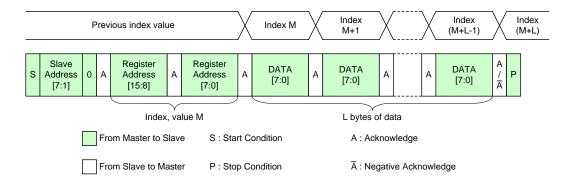

The Master sets the sensor index value to M by designating the sensor slave address with a write request, and designating the address (M). After that the Master can write the value in the designated register by transmitting the data to be written. After writing the necessary data, the Master generates the Stop Condition to end the communication.

Single Write to Random Location

Sequential Write Starting from Random Location

The Master can write a value to register address M by designating the sensor slave address with a write request, designating the address (M), and then transmitting the data to be written. After the sensor receives the write data, it outputs an Acknowledge and at the same time increments the register address, so the Master can write to the next address simply by continuing to transmit data. After the Master writes the necessary number of bytes, it generates the Stop Condition to end the communication.

Sequential Write Starting from Random Location

Register Map

There are some functions that address is change according to communication method. When described as (I^2C) , this function will be enabled by I^2C communication. When described as (4-wire), this function will be enabled by 4-wire communication.

^{*1} The STANDBY (Address 00h [0]) register is reflected at the following timings.

[•]When canceling standby mode: Reflected immediately

[•]When entering standby mode: Reflected immediately after the end of the frame during which the setting was made

The values must be changed from the default values, so initial setting after reset is required after power-on. Subsequent setting by communication is not needed unless the power is turned Off or the system is reset.

[&]quot;V" in the "Reflection timing" column indicates that the setting value is reflected at the falling edge of the next XVS after the register communication is performed.

Do not perform communication to addresses not listed in the Register Map. Doing so may result in malfunction. However, other registers that require communication to addresses not listed above may be added, so addresses up to FFh should be supported for both CID = 02h and 03h.

Readout Drive Mode

The table below lists the operating modes available with this sensor.

				Imaging c	onditions				
Drive mode	INCK	Frame rate	Output Resolution	Data Rate	Numl effectiv	per of e pixels	Data width*1		1H
	[MHz]	[frame/s]	[bit]	[Mpixel/s]	H [pixels]	V [lines]	H [INCK]	V [lines]	Period [µs]
	37.125	15.00	10/12	37.125	1984	1105	2200		59.26
HD1080 p		25.00	10/12	74.25			1320	1125	35.56
		30.00	10/12	74.25			1100		29.63
HD720 p		30.00	10/12	37.125	4044	745	1650	750	44.44
		60.00	10	74.25	1344	745	825	730	22.22

^{*1} The data width indicates the output sync signal period in master mode. In slave mode the data width is the input XVS and XHS clock interval.

SONY IMX322LQJ-C

Sync Code

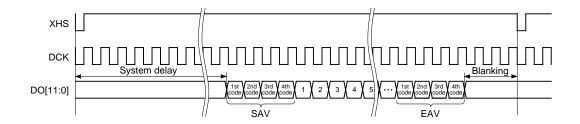

The sync code is added immediately before and after "dummy signal + OB signal + effective pixel data" and then output. The sync code is output in order of 1st, 2nd, 3rd and 4th. The fixed value is output for 1st to 3rd. (BLK: Blanking period)

Sync Code Output Timing (Parallel CMOS Output)

Sync Code Output Timing

The sensor output signal passes through the internal circuits and is output with a latency time (system delay) relative to the horizontal sync signal. This system delay value is undefined for each line, so refer to the sync codes output from the sensor and perform synchronization.

IMX322LQJ-C

Image Data Output Format

HD1080 p Mode

The sensor signal is cut out with the angle of view for HD1080p (1920 \times 1080) and read.

Pixel Array Image Drawing in HD720p Mode

Drive Timing Chart in HD720p Mode

Description of Various Functions

Standby mode

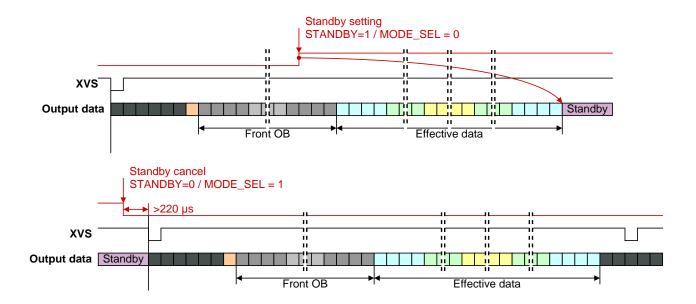

This sensor stops its operation and goes into standby mode which reduces the power consumption by writing "1" to the standby control register STANDBY (address 00h, Bit [0]), in 4-wire communication, writing "0" to the register MODE_SEL (address 0100h, Bit [0]) (Standby mode immediately after power-on and reset).

Standby mode is reflected after V. OB after the set frame.

Write to register is possible because the serial communication function operates even in standby mode. Set the STANDBY register to "0" to cancel standby mode. The standby cancel is immediately reflected from the communication.

List of Standby Mode Setting

	Regist	er details		Initial	Cotting	Sta	tus	
Communication	Register name	Address	Bit	value	Setting value	Digital circuit	Analog circuit	Remarks
4-wire	STANDBY	00h	[0]	1	1 (Standby)	Stop	Stop	Register
					0	Operate	Operate	communication
I ² C	MODE_SEL	0100h	[0]	1	0 (Standby)	Stop	Stop	is executed even in standby mode.
					1	Operate	Operate	

Standby Mode Change Timing

IMX322LQJ-C

Slave Mode and Master Mode

The sensor can be switched between slave mode and master mode. The switching is made by the XMASTER pin.

Set the XMSTA register (address 2Ch [0]) to "0" in order to start the operation after setting to master mode. In addition, set the count number of sync signal in vertical direction by the VMAX register (address 05h [7:0], 06h [7:0]) (4-wire) / FRM_LENGTH register (address 0340h [7:0], 0341h [7:0]) (I²C) and the clock number in horizontal direction by the HMAX register (address 03h [7:0], 04h [5:0]) (4-wire) / LINE_LENGTH register (address 0342h [7:0], 0343h [5:0]). See the description of Operation Mode for details of drive mode.

List of Slave and Master Mode Setting

Pin name	Pin processing	Operation mode	Remarks	
VMACTED nin	Low fixed	Master Mode	High: 1.8 V	
XMASTER pin	High fixed	Slave Mode	Low: GND	

	Description	on of registe	r	Initial	Setting	Status

	LENGTH	0343h	[7:0]	044011			frame designated	

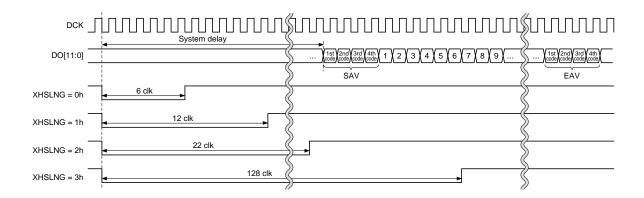

When a sensor is in slave mode, values set in the registers of the list above are invalid.

The XVS and XHS are output in timing that set 0 to the register XMSTA. If set 0 to XMSTA during standby, the XVS and XHS are output just after standby is released. The XVS and XHS are output asynchronous with other input or output signals. In addition, the output signals are output with a undefined latency time (system delay) relative to the XHS. Therefore, refer to the sync codes output from the sensor and perform synchronization.

XHSLNG Selection

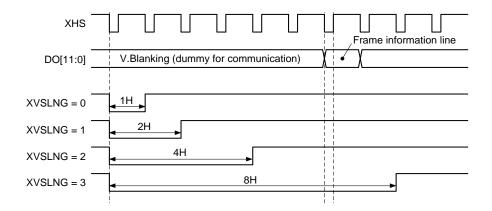

The signal of horizontal sync signal XHS is set by the XHSLNG register. The output has system delay from the XHS fall to effective data (sync code) output.

List of XHS Pulse Width Setting

XVSLNG Selection

The signal of vertical sync signal XVS is set.

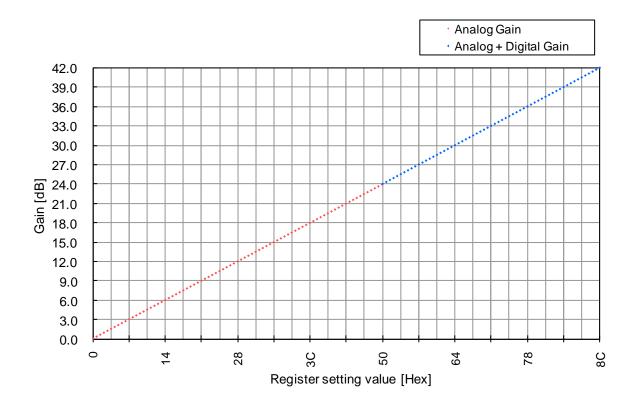

List of XVS Pulse Width Setting

Gain Adjustment Function

The Programmable Gain Control (PGC) of this device consists of the analog block and digital block. The total of analog gain and digital gain can be set up to 42 dB by the GAIN register (address 1Eh [7:0]) setting.

See the List of Gain Setting Register Value for Each Register.

List of PGC Register

SONY IMX322LQJ-C

Black Level Adjustment Function

The black level offset (offset variable range: 03Ch to 1FFh) can be added relative to the data in which the digital gain modulation was performed by the BLKLEVEL register (address: 20h [7:0], 21h [0]). When the BLKLEVEL setting is increased by 1 LSB, the black level is increased by 1 LSB.

Use with values shown below is recommended.

10-bit output: 3Ch (60d) 12-bit output: F0h (240d)

List of Black Level Adjustment Register

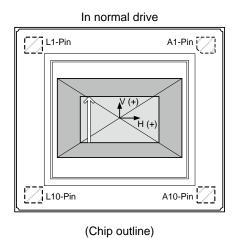

Communication	Re	gister details		Setting value		
Communication	Register name	Address	Bit	miliai value	Min.	Max.

I ² C	I ² C BLKLEVEL	0009h	[7:0]	040h	03Ch	

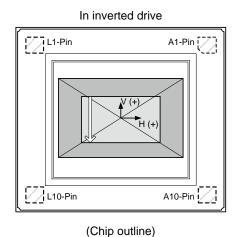

Vertical Normal Operation and Inverted Drive

The sensor readout direction (normal/inverted) in vertical direction can be switched by the VREVERSE (address 01h [0]) / IMG_ORIENTATION (address 0101h [1]) register setting. See the item of "Drive mode" for the order of readout lines in normal and inverted modes. One invalid frame is generated when reading immediately after the readout direction change in order to switch the normal operation and inversion between frames.

List of Vertical Drive Direction Setting Register

I ² C	IMG_ORIENTATION	0101h	[1]	0	0	1

Normal and Inverted Drive Outline in Vertical Direction

Shutter and Integration Time Settings

This sensor has a variable electronic shutter function that can control the integration time in line units. In addition, this sensor performs rolling shutter operation in which electronic shutter and readout operation are performed sequentially for each line.

Note) For integration time control, an image which reflects the setting is output from the frame after the setting changes.

Example of Integration Time Setting

The sensor's integration time is obtained by the following formula.

Integration time = 1 frame period x (SVS + 1 - SPL) - (SHS1) x (1H period) - 0.3 [H] (However, SVS > SPL)

- Note) 1. The frame period is determined by the input XVS when the sensor is operating in slave mode, or the register VMAX value in master mode. The frame period is designated in 1H units, so the time is determined by (Number of lines × 1H period).
 - 2. See "Drive Modes" for the 1H period.

In this item, the shutter operation and integration time are shown as in the figure below with the time sequence on the horizontal axis and the vertical address on the vertical axis. For simplification, shutter and readout operation are noted in line units.

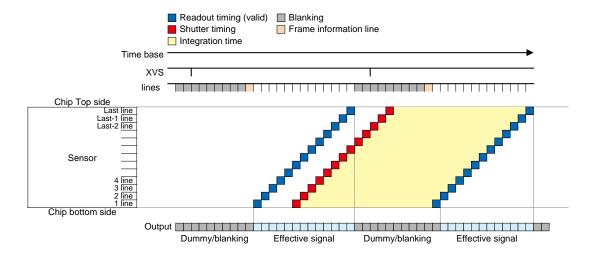

Image Drawing of Shutter Operation

Normal Exposure Operation (Controlling the Integration Time in 1H Units)

The integration time can be controlled by varying the electronic shutter timing. In the electronic shutter settings, the integration time is controlled by the SHS1 register (address: 08h [7:0], 09h [7:0]) (4-wire) / INTEG_TIME register (address: 0202h [7:0], 0203h [7:0]) (1^2C).

Set SHS1/INTEG_TIME to a value between 0 and (Number of lines per frame - 1). When the sensor is operating in slave mode, the number of lines per frame is determined by the XVS interval (number of lines), using the input XHS interval as the line unit. When the sensor is operating in master mode, the number of lines per frame is determined by the VMAX register (address: 05h [7:0], 06h [7:0]) (4-wire) / FRM_LENGTH register (address: 0340h [7:0], 0341h [7:0]) (1²C). The number of lines per frame varies according to the drive mode.

Registers Used to Set the Integration Time in 1H Units

	Reg	ister details		Initial	
Communication	Register name	Address	Bit	value	Description
	SHS1	08h	[7:0]	0000h	Sets the shutter sweep time.
	SHOT	09h	[7:0]	000011	Sets the shutter sweep time.
4-wire		05h	[7:0]		Sets the number of lines per frame (only in master mode).
	VMAX	06h	[7:0]	04E2h	See "Operating Modes" for the setting value in each mode.
	INTEG_	0202h	[7:0]	0000h	Sets the shutter sweep time.
,20	TIME	0203h	[7:0]	000011	
I ² C	FRM	0340h	[7:0]		Sets the number of lines per frame (only in master mode).
	LENGTH	0341h	[7:0]	04E2h	See "Operating Modes" for the setting value in each mode.

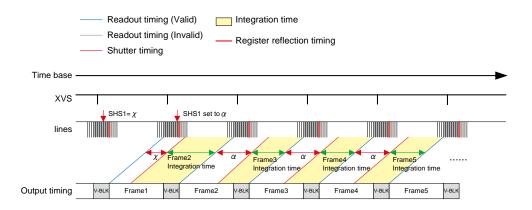

Image Drawing of Integration Time Control within a Frame

IMX322LQJ-C

Long Exposure Operation (Control by Expanding the Number of Lines per Frame)

Long exposure operation can be performed by lengthening the frame period.

When the sensor is operating in slave mode, this is done by lengthening the input vertical sync signal (XVS) pulse interval. When the sensor is operating in master mode, it is done by designating a larger register VMAX (address: 05h [7:0], 06h [7:0]) value compared to normal operation.

Likewise, in slave mode the integration time can be increased by lengthening the input XVS signal pulse interval. When the integration time is extended by increasing the number of lines, the rear V blanking increases by an equivalent amount.

The maximum VMAX and SHS1 values are 65535d. When the number of lines per frame is set to the maximum value, the integration time in HD1080p mode at 30 frame/s is approximately 1.9 s. When set to a number of V lines or more than that noted for each readout drive mode, the imaging characteristics are not guaranteed during long exposure operation.

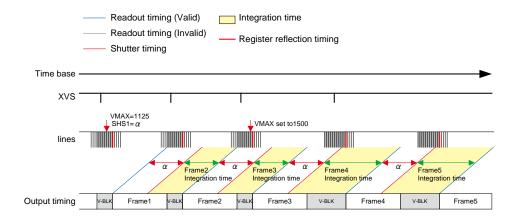

Image Drawing of Long Exposure Time Control by Adjusting the Frame Period

Long Exposure Operation (Controlling the Integration Time in Frame Units)

When setting a long exposure that extends the integration time to one frame or more, set the SVS register (address: 0Fh [7:0], 10h [1:0]) to the value of (Number of integration frames - 1). In addition, the frame in which the shutter operates is designated by the SPL register (address: 0Dh [7:0], 0Eh [1:0]). To further adjust the integration time in 1H units within the frame set by SPL, set the SHS1 / INTEG_TIME register. However, note that performing long integration causes the readout timing and the setting reflection timing to be eliminated according to the value set by SVS, so the frame rate drops. The blanking signal is output in data corresponding to the drop in the frame rate.

- ◆ This description is for the settings in master mode. In slave mode, long integration is set by eliminating the input vertical sync signal (XVS) pulse.
- When set so that SVS < SPL, the SPL setting value is ignored, and the signal is stored for the number of frames designated by SVS.
- ◆ Set SHS1 to a value between 0 and (Number of lines per frame 7).
- During long exposure operation, register communication is also reflected at the eliminated timing. To forcibly
 end operation partway, use the shutter break function.
- ◆ The imaging characteristics are not guaranteed during long exposure operation that performs integration for 2 frames or more.

Registers Used to Set the Integration Time in Frame Units

	Regis	Register details			
Communication	Register name	Address (I ² C)	Bit	Initial value	Description
	SSBRK	12h (3012h)	[0]	1h	Shutter break function. Set both SVS and SPL to "0" simultaneously with this setting.
	svs	0Fh (300Fh)	[7:0]	000h	Designates the number of integration frames.
4-wire / I ² C	373	10h (3010h)	[1:0]	ooon	Integration time = Setting value + 1 frame
	SPL	0Dh (300Dh)	[7:0]	000h	Designates the number of sweep frames.
	SIL	0Eh (300Eh)	[1:0]	00011	Designates the number of sweep frames.
		08h	[7:0]		Sets the shutter sweep time.
4-wire	SHS1	SHS1 09h	[7:0]	0000h	Note) When SVS is set to more than 1h, SHS1 is limited to less than VMAX-7.
.2 -		0202h	[7:0]		Sets the shutter sweep time.
I ² C	INTEG_TIME	0203h	[7:0]	0000h	Note) When SVS is set to more than 1h, SHS1 is limited to less than VMAX-7.

^{*} Integration time control is reflected to the next readout frame after the frame during which the setting was made.

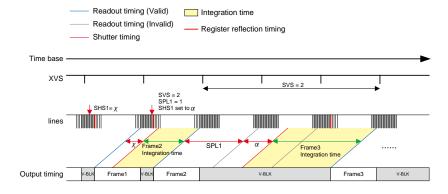

Image Drawing of Long Exposure Control in Frame Unit

Example of Integration Time Setting

The example of register setting for controlling the integration time is shown below.

Example of Integration Time Setting (in HD1080p mode)

	S	Sensor se	etting (Re	gister)				
Operation	VMAX*	SVS	SPL	SHS1 / INTEG_TIME	Integration time

			:		:			
		V	L		$\{VMAX \times (V + 1 - L) - N - 0.3\} H period$			

^{*} In sensor master mode. XVS interval to be input in slave mode.

^{*} The SHS1 setting value (N) is set to the VMAX value (M) of -7 to 0 when SVS is 1 or over.

IMX322LQJ-C

Shutter Break Function

When changing the integration time setting before the next reflection timing (readout timing) during long integration operation, the setting can be reflected at the normal XVS timing (when the register SVS is set to "0h") by setting the SSBRK register (address: 12h [0]) to "01h". The timing at which the SSBRK register is reflected conforms to the frame sequence before SVS is set.

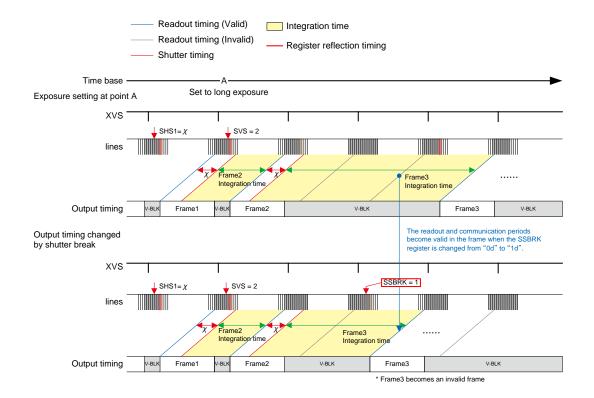

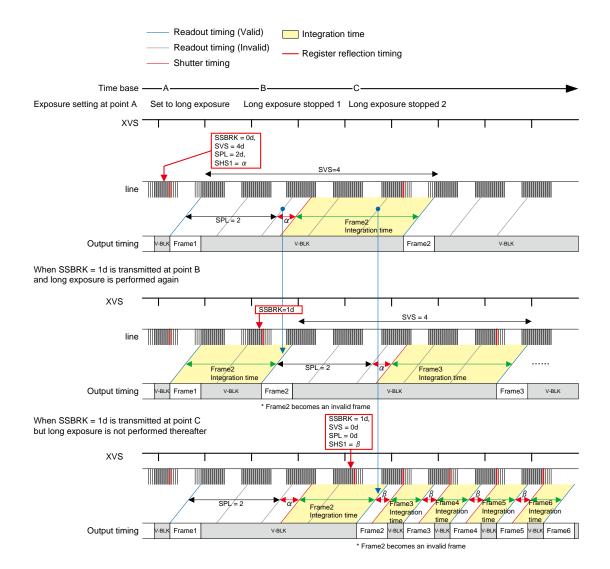

Image Drawing of Shutter Break Function

Depending on the value set when long integration operation starts (point "A" on the time base), the scheduled output can be stopped partway and settings can be changed as shown in the figure above. In this case, readout occurs in the frame when the SSBRK register is transmitted, and the signal stored up to that point is output. In this case the signal output in the frame when SSBRK is set becomes an invalid signal. In addition, perform communication at the next communication timing to return the SSBRK register to "0d".

Example Showing Application of the Shutter Break Function

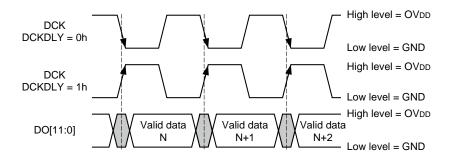

When the SVS and SPL register values are left unchanged after the shutter break, readout is performed and then long integration starts again. To stop long integration with shutter break, the SVS and SPL register values must both be set to "0d" during the communication period of the frame during which shutter break is performed.

IMX322LQJ-C

Output Signal Interface Control

This sensor supports the following output formats. See "Image Data Output Format" for the data rate. Shaded areas in the figure indicate invalid data with regards to the AC characteristics. See "AC Characteristics" for details.

Example of Pin Waveform in CMOS 1-port SDR Output Mode

The sensor signal is output in sync with the falling edge of the data clock (DCK). (When DCKDLY is set to "0h") Output in sync with the rising edge is possible by setting DCKDLY to "1h".

Output Formats and Setting Methods

	Regist	er details		Initial		
Communication	Register name	Address (I ² C)	Bit	value	Description	
4-wire	ADRES	12h	[1]	0	0: 10-bit output, 1: 12-bit output	
I ² C	I ² C ADRES1	0112h	[7:0]	0Ah	0Ah: 10-bit output, 0Ch: 12-bit output	
10	I ² C ADRES2	0113h	[7:0]	0Ah	0Ah: 10-bit output, 0Ch: 12-bit output	
4-wire/l ² C	DCKDLY	2Dh (302Dh)	[1]	0	Output in sync with the 0: falling edge, 1:rising edge.	

Output Signal Range

The output gradation of this sensor can be switched to 10 bits or 12 bits. In parallel CMOS output mode, the output 10 bits or 12 bits are assigned to 10 pins or 12 pins, respectively. When set to 10 bits, the data is output from DO11 to DO2, and the unused pins are fixed Low.

Bit Assignment for Each Output Gradation

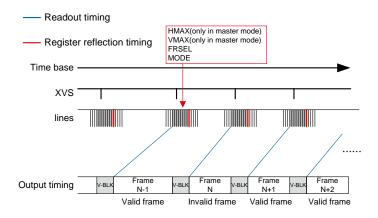

DO nin	Output bit a	assignment
DO pin	10 bit	12 bit
DO [11]	DO [9]	DO [11]
DO [10]	DO [8]	DO [10]
DO [9]	DO [7]	DO [9]
DO [8]	DO [6]	DO [8]
DO [7]	DO [5]	DO [7]
DO [6]	DO [4]	DO [6]
DO [5]	DO [3]	DO [5]
DO [4]	DO [2]	DO [4]
DO [3]	DO [1]	DO [3]
DO [2]	DO [0]	DO [2]
DO [1]	Fixed to "0"	DO [1]
DO [0]	Fixed to "0"	DO [0]

Output Range

Output gradation	Output range				
Output gradation	Minimum value	Maximum value			
10 bit	000h	3FEh			
12 bit	000h	FFEh			

Mode Transitions

When changing the drive mode during sensor drive operation, an invalid frame is output. Data is output from sensor during the invalid frame period, but the output values may not reflect the integration time or may not be uniform on the screen, or a partially saturated image may be output.

*When changing the drive mode also changes the frame period, the number of invalid frames is counted according to the frame period after the change.

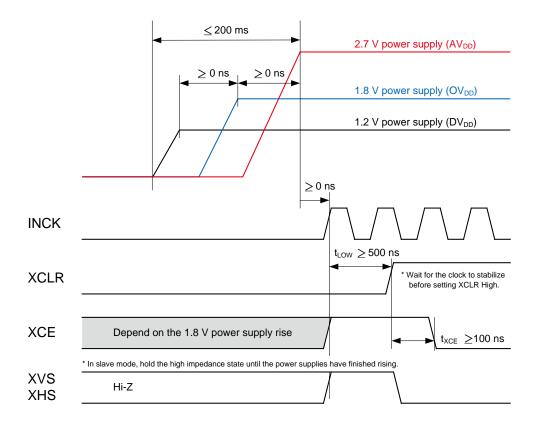

Invalid Frame Generation Timing

Power-on/off Sequence

Power-on Sequence

Follow the sequence below to turn on the power supplies.

- Turn on the power supplies so that the power supplies rise in order of 1.2 V power supply (DV_{DD}) →
 1.8 V power supply (OV_{DD}) → 2.7 V power supply (AV_{DD}). In addition, all power supplies should finish rising within 200 ms.
- 2. Start master clock (INCK) input after turning on the power supplies.
- 3. The register values are undefined immediately after power-on, so the system must be cleared. Hold XCLR at Low level for 500 ns or more after all the power supplies have finished rising. (The register values after a system clear are the default values.) In addition, hold XCE at High level during this period. The XCE rise timing differs according to the 1.8 V power supply (OV_{DD}), so hold XCE at High level until INCK is input. The system clear is applied by setting XCLR to High level. However, the master clock needs to stabilize before setting the XCLR pin to High level.
- 4. Make the sensor settings by register communication after the system clear. A period of 100 ns or more should be provided after setting XCLR High before inputting the communication enable signal XCE in 4-wire communication.

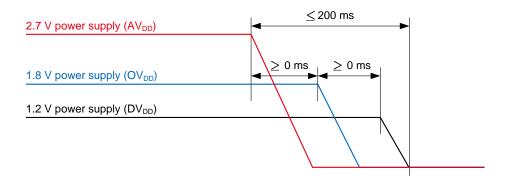

Power-on Sequence

IMX322LQJ-C

Power-off Sequence

Turn Off the power supplies so that the power supplies fall in order of 2.7 V power supply (AV_{DD}) \rightarrow 1.8 V power supply (OV_{DD}) \rightarrow 1.2 V power supply (DV_{DD}). In addition, all power supplies should finish falling within 200 ms. Set each digital input pin (INCK, XCE, SCK, SDI, XCLR, XMASTER, XVS, XHS) to 0 V or high impedance before the 1.8 V power supply (OV_{DD}) falls.

Power-off Sequence

IMX322LQJ-C

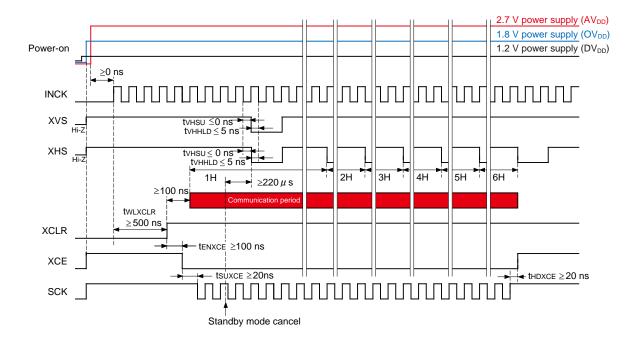

Serial Communication Period after Sensor Reset

Slave mode

The communication period is set at the timing shown below for the sensor initial settings immediately after power-on. In slave mode, the vertical and horizontal sync signals (XVS, XHS) become valid only from the falling edges 100 ns or more after sensor reset (after XCLR is set Low). The 6H serial communication period is from the falling edge of the first valid XVS to the sixth XHS falling edge thereafter.

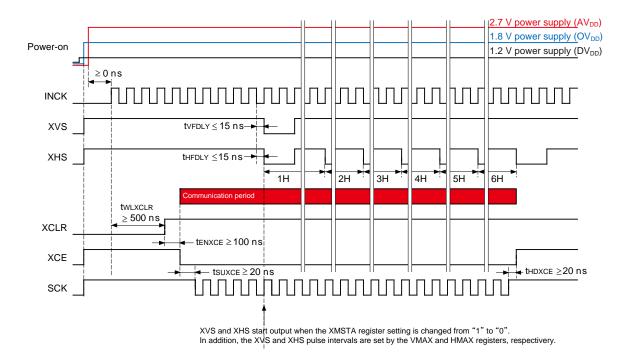

Note) XVS and XHS signals input when XCLR is Low are ignored. At this time the sensor is in standby mode until the next XVS signal. Register communication is possible in standby mode.

Communication Period after Sensor Reset in Slave Mode

Master mode

In master mode, the HMAX register (address 03h [7:0], 04h [5:0]) initial value is "44Ch" and the VMAX register (address 05h [7:0], 06h [7:0]) initial value is "4E2h", so both XVS and XHS are output at these initial setting V and H widths until the setting values are reflected 6H later. When the VMAX and HMAX registers are set to arbitrary values by serial communication at the initial setting, and the master mode start register XMSTA (address 2Ch [0]) setting is changed from "1" to "0", XVS and XHS start output according to the set values from the 7th H after the register settings are reflected. However, when VMAX and HMAX are set during the standby period, XVS and XHS are output according to the set values after standby is canceled.

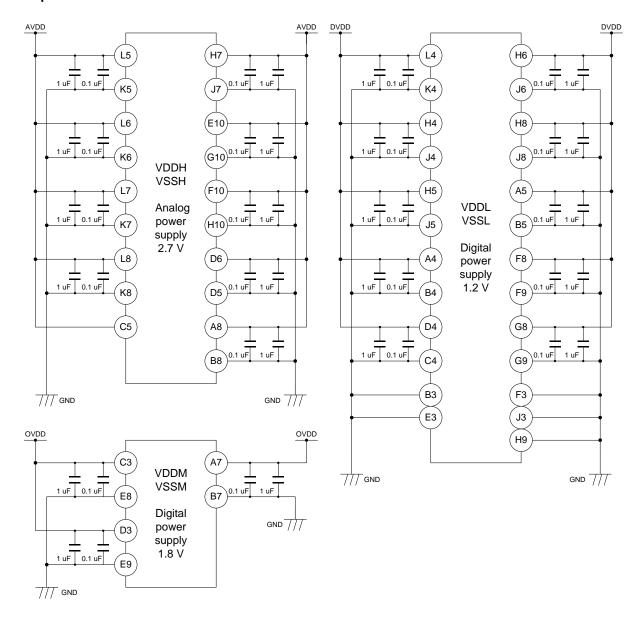

Communication Period after Sensor Reset in Master Mode

Spot Pixel Specifications

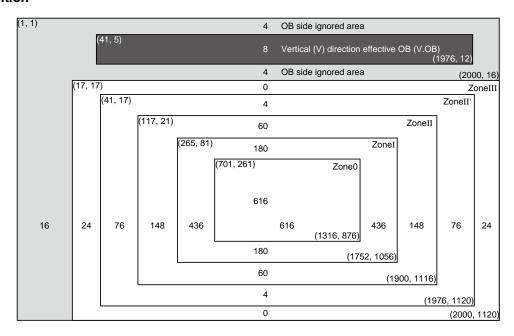

(AV_{DD} = 2.7 V, OV_{DD} = 1.8 V, DV_{DD} = 1.2 V, Tj = 60 $^{\circ}$ C, 30 frame/s, Gain: 0 dB)

				mum distorted pixels in each zone			Magazzamant	
Type of distortion	Level		0 to II'	Effective OB	I	Ineffective OB	Measurement method	Remarks
Black or white pixels at high light	30 % ≤ D)	17	No evaluation criteria applied		1		
White pixels in the dark	5.6 mV ≤ D)	4	No evaluation 400 criteria applied		2	Tj = 60 °C 1/30 s integration	
Black pixels at signal saturated	D ≤ 63	39 mV	0	0 No evaluation criteria applied		3		

Note) 1. Zone is specified based on all-pixel drive mode.

- 2. D...Spot pixel level.
- 3. See the Spot Pixel Pattern Specifications for the specifications in which white pixel and black pixel are close.

Zone Definition

Notice on White Pixels Specifications

After delivery inspection of CMOS image sensors, cosmic radiation may distort pixels of CMOS image sensors, and then distorted pixels may cause white point effects in dark signals in picture images. (Such white point effects shall be hereinafter referred to as "White Pixels".) Unfortunately, it is not possible with current scientific technology for CMOS image sensors to prevent such White Pixels. It is recommended that when you use CMOS image sensors, you should consider taking measures against such White Pixels, such as adoption of automatic compensation systems for White Pixels in dark signals and establishment of quality assurance standards. Unless the Seller's liability for White Pixels is otherwise set forth in an agreement between you and the Seller, Sony Corporation or its distributors (hereinafter collectively referred to as the "Seller") will, at the Seller's expense, replace such CMOS image sensors, in the event the CMOS image sensors delivered by the Seller are found to be to the Seller's satisfaction, to have over the allowable range of White Pixels as set forth as set forth above under the heading "Spot Pixels Specifications", within the period of three months after the delivery date of such CMOS image sensors from the Seller to you; provided that the Seller disclaims and will not assume any liability after if you have incorporated such CMOS image sensors into other products. Please be aware that Seller disclaims and will not assume any liability for (1) CMOS image sensors fabricated, altered or modified after delivery to you, (2) CMOS image sensors incorporated into other products, (3) CMOS image sensors shipped to a third party in any form whatsoever, or (4) CMOS image sensors delivered to you over three months ago. Except the above mentioned replacement by Seller, neither Sony Corporation nor its distributors will assume any liability for White Pixels. Please resolve any problem or trouble arising from or in connection with White Pixels at your costs and expenses.

[For Your Reference] The Occurrence Rate of White Pixels

The chart below shows the predictable data on the occurrence rates of White Pixels in a single-story building in Tokyo at an altitude of 0 meters. It is recommended that you should consider taking measures against White Pixels, such as adoption of automatic compensation systems appropriate for each occurrence rate of White Pixels.

The data in the chart is based on records of past field tests, and signifies estimated occurrence rates calculated according to structures and electrical properties of each device. Moreover, the data in the chart is for your reference purpose only, and is not to be used as part of any CMOS image sensor specifications.

Example of Occurrence Rates

White Pixel Level (in case of storage time = $1/30 \text{ s}$) (Ta = $60 ^{\circ}\text{C}$)	Occurrence Rate per week
5.6 mV or higher	27.8 %
10.0 mV or higher	15.9 %
24.0 mV or higher	6.9 %
50.0 mV or higher	3.4 %
72.0 mV or higher	2.4 %

- Note 1) The above data indicates the average occurrence rate of a single White Pixels that will occur when a CMOS image sensor is left for a week.
 - For example, in a case of a device that has a 1 % occurrence rate per week at the 5.6 mV or higher effect level, this means that if 1,000 devices are left for a week, a total of 10 devices out of the whole 1,000 devices will have a single White Pixels at the 5.6 mV or higher effect level.
- Note 2) The occurrence rate of White Pixels fluctuates depending on the CMOS image sensor storage environment (such as altitude, geomagnetic latitude and building structure), time (solar activity effects) and so on. Moreover, there may be statistic errors. Please take notice and understand that this is an example of test data with experiments that have being conducted over a specific time period and in a specific environment.
- Note 3) This data does not guarantee the upper limits of the occurrence rate of White Pixels.

For Your Reference:

The occurrence rate of White Pixels at an altitude of 3,000 meters is from 5 to 10 times more than that at an altitude of 0 meters because of the density of the cosmic rays. In addition, in high latitude geographical areas such as London and New York, the density of cosmic rays increases due to a difference in the geomagnetic density, so the occurrence rate of White Pixels in such areas approximately doubles when compared with that in Tokyo.

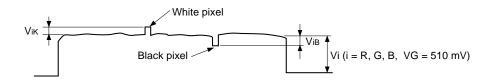

Measurement Method for Spot Pixels

After setting the measurement condition to the standard imaging condition II, and the device drive conditions are within the bias and clock voltage conditions. Configure the drive circuit according to the example and measure.

1. Black or white pixels at high light

After adjusting the average value of the Gr/Gb signal output to 510 mV, measure the local dip point (black pixel at high light, ViB) and the peak point (white pixel at high light, ViK) in the Gr/Gb/R/B signal output Vi (i = Gr/Gb/R/B), and substitute the values into the following formula.

Spot pixel level D = $\{(Vi_B \text{ or } Vi_K)/Vi \text{ average value}\} \times 100 [\%]$

Signal output waveform of R/G/B channel

2. White pixels in the dark

Set the device to a dark setting and measure the local peak point of the signal output waveform using the average value of the dark signal output as a reference.

3. Black pixels at signal saturated

Set the device to operate in saturation and measure the local dip point using the OB output as a reference.

Signal output waveform of R/G/B channel

Spot Pixel Pattern Specifications

Spot pixel patterns are counted as shown below.

List of Spot Pixel Patterns

No.	Pattern	White pixel / Black pixel / Bright pixel
1		Rejected
2		
3		Allowed
4		Allowed
5		

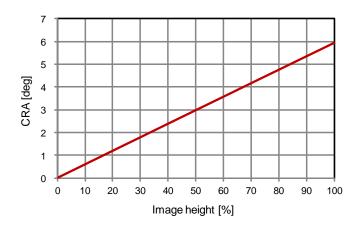

- Note) 1. ●: Black circles indicate the positions of spot pixels. The patterns are specified separately for white pixels, black pixels and bright spots.
 - (Example: Even when a black pixel and a white pixel are arranged as shown by pattern No. 1, this is not judged as a defect (Allowed).)
 - 2. Sensors exhibiting one or more patterns indicated as "Rejected" are sorted and removed.
 - 3. Sensors exhibiting patterns indicated as "Allowed" are not subject to sorting and removal, and these pixels are instead counted in the number of allowable spot pixels by zone.
 - 4. White pixels and black pixels other than the patterns noted in the table above are all counted in the number of allowable spot pixels by zone.

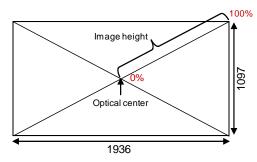

CRA Characteristics

(Exit pupil distance: -30 mm)

The recommended CRA characteristics is 0.0 degrees all over the image height (0 - 100 %), because the target E.P.D. is infinite.

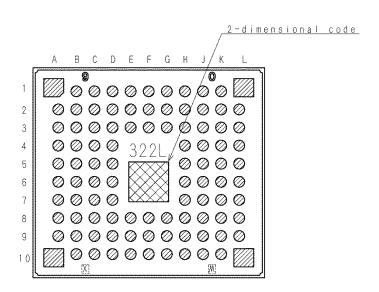

We assume that the worst case of E.P.D. is -30 mm. The CRA characteristics of -30 mm E.P.D. is described below. The real CRA should be smaller than the table below.

lan a ma	CRA			
ımage	Image height			
(%)	(mm)	(deg)		
0	0.00	0.00		
5	0.16	0.30		
10	0.31	0.59		
15	0.47	0.89		
20	0.62	1.19		
25	0.78	1.49		
30	0.93	1.78		
35	1.09	2.08		
40	1.25	2.38		
45	1.40	2.68		
50	1.56	2.97		
55	1.71	3.27		
60	1.87	3.57		
65	2.02	3.86		
70	2.18	4.16		
75	2.34	4.45		
80	2.49	4.75		
85	2.65	5.04		
90	2.80	5.34		
95	2.96	5.63		
100	3.12	5.93		

Marking

Note: Following characters enter into "W", and "X". (No Au coat) W: In English upper case character, One character X: Number, single number

DRAWING No. AM-C322LQJC(2D)

Notes On Handling

1. Static charge prevention

Image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.

- (1) Either handle bare handed or use non-chargeable gloves, clothes or material. Also use conductive shoes.
- (2) Use a wrist strap when handling directly.
- (3) Install grounded conductive mats on the floor and working table to prevent the generation of static electricity.
- (4) Ionized air is recommended for discharge when handling image sensors.
- (5) For the shipment of mounted boards, use boxes treated for the prevention of static charges.

2. Protection from dust and dirt

Image sensors are packed and delivered with care taken to protect the element glass surfaces from harmful dust and dirt. Clean glass surfaces with the following operations as required before use.

- (1) Perform all lens assembly and other work in a clean environment (class 1000 or less).
- (2) Do not touch the glass surface with hand and make any object contact with it. If dust or other is stuck to a glass surface, blow it off with an air blower. (For dust stuck through static electricity, ionized air is recommended.)
- (3) Clean with a cotton swab with ethyl alcohol if grease stained. Be careful not to scratch the glass.
- (4) Keep in a dedicated case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
- (5) When a protective tape is applied before shipping, remove the tape applied for electrostatic protection just before use. Do not reuse the tape.

3. Installing (attaching)

- (1) If a load is applied to the entire surface by a hard component, bending stress may be generated and the package may fracture, etc., depending on the flatness of the bottom of the package. Therefore, for installation, use either an elastic load, such as a spring plate, or an adhesive.
- (2) The adhesive may cause the marking on the rear surface to disappear.
- (3) If metal, etc., clash or rub against the package surface, the package may chip or fragment and generate dust.
- (4) Acrylate anaerobic adhesives are generally used to attach this product. In addition, cyanoacrylate instantaneous adhesives are sometimes used jointly with acrylate anaerobic adhesives to hold the product in place until the adhesive completely hardens. (Reference)
- (5) Note that the sensor may be damaged when using ultraviolet ray and infrared laser for mounting it.

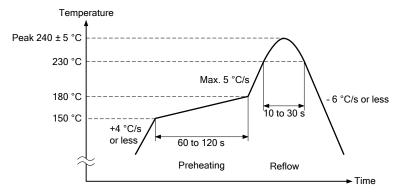

4. Recommended reflow soldering conditions

The following items should be observed for reflow soldering.

(1) Temperature profile for reflow soldering

Control item	Profile (at part side surface)
1. Preheating	150 to 180 °C 60 to 120 s
2. Temperature up (down)	+4 °C/s or less (- 6 °C/s or less)
3. Reflow temperature	Over 230 °C 10 to 30 s Max. 5 °C/s
4. Peak temperature	Max. 240 ± 5 °C

(2) Reflow conditions

- (a) Make sure the temperature of the upper surface of the seal glass resin adhesive portion of the package does not exceed 245 °C.
- (b) Perform the reflow soldering only one time.
- (c) Finish reflow soldering within 72 h after unsealing the degassed packing. Store the products under the condition of temperature of 30 °C or less and humidity of 70 % RH or less after unsealing the package.
- (d) Perform re-baking only one time under the condition at 125 $^{\circ}\text{C}$ for 24 h.

(3) Others

- (a) Carry out evaluation for the solder joint reliability in your company.
- (b) After the reflow, the paste residue of protective tape may remain around the seal glass. (The paste residue of protective tape should be ignored except remarkable one.)
- (c) Note that X-ray inspection may damage characteristics of the sensor.

5. Others

- (1) Do not expose to strong light (sun rays) for long periods, as the color filters of color devices will be discolored.
- (2) Exposure to high temperature or humidity will affect the characteristics. Accordingly avoid storage or use in such conditions.
- (3) This product is precision optical parts, so care should be taken not to apply excessive mechanical shocks or force.
- (4) Note that imaging characteristics of the sensor may be affected when approaching strong electromagnetic wave or magnetic field during operation.
- (5) Note that image may be affected by the light leaked to optical black when using an infrared cut filter that has transparency in near infrared ray area during shooting subjects with high luminance.
